CT gestation week 4 (pregnancy not recognized)
The uterus is slightly enlarged, but no clear pathological findings. Distinct corpus luteum cyst..
MR 15 weeks of gestation

Enlarged uterus with fetus, placenta and edematous uterine wall making the endometrium difficult to assess. Pregnancy-related changes make diffusion weighted imaging challenging to interpret. Contrast-enhanced sequences not performed. No tumor is identified, but the scan’s reduced sensitivity make non-bulky tumor hard to exclude.
Supplementary material

MR 15 weeks of gestation
Enlarged uterus with embryo, placenta and edematous uterine wall making the endometrium difficult to assess. Pregnancy-related changes make diffusion weighted imaging challenging to interpret. Contrast-enhanced sequences not performed. No tumor is identified, but the scan’s reduced sensitivity make non-bulky tumor hard to exclude.

MR 18.04.18
MR 6 weeks post partum

- Ceasarian scar
- Intramural leiomyoma.non-perfused
- Uterine cavity with bloody content
- Irregular endometrial lining
Additional sequences if more images are needed.

MR post partum
