eduction, duration of marriage, occupation, type of disease, and administration of chemotherapy.

Conclusions Sexuality after cancer affecting the female genital area is altered, age >50 years, illiteracy, length of marriage >20 years as well as endometrial, vulva and vaginal cancers were predictive factors of sexual dysfunction.

**THE IMPACT OF PATIENT TRAVEL DISTANCE ON QUALITY INDICATORS IN GYNECOLOGIC SURGERY**

1R Cowan*, 1J Frame, 2S Samedy, 3N Zhou, 1K Long Roche, 1D Chi, 4K Sepkowitz, 1N Abu-Rustum, 5G Gardner. 1Memorial Sloan Kettering Cancer Center, Department of Surgery, New York, USA; 2Memorial Sloan Kettering Cancer Center, Quality and Safety, New York, USA; 3Memorial Sloan Kettering Cancer Center, Office of Physician-in-Chief, New York, USA.

**Objectives** To characterize patient travel distance to a comprehensive cancer center (CC) for gynecologic surgery; to determine the impact of travel distance on perioperative quality indicators.

**Methods** Patients who underwent first gynecologic surgery at a CC from 1/2000–3/2018 were identified. Travel distance was defined as “close” (≤50 mi) or “far” (>50 mi). Patient demographics, procedural complexity, rates of reoperation, reporting to improve safety and quality (RISQ) events, and postoperative mortality were identified.

**Results** Of 23,340 patients, 19,246 were included in the close group and 4,094 in the far group. Median distance traveled was 19.25mi (range 0–4963): 14.35mi for close group, 85.21mi far group. Median age was 55 years (range 18–97). There was no difference in age (p=0.87) or ASA status (p=0.16) between groups. Patients in the far group underwent more complex procedures based on RVUs (p=0.00) and case length (p=0.00) and had 1-day longer length of stay (p=0.003). There were more non-White (p=0.00), non-English speaking (p=0.00), and unmarried (p=0.00) patients in the close group. There was no difference in rate of reoperation (p=0.95) or 30-, 60-, or 90-day mortality (p=0.33, 0.30, 0.34) between groups. Patients who traveled farther had 1% more RISQ events (p=0.003), but this did not hold on multi-variant analysis.

**Conclusions** We demonstrate that patients who travel for centralized specialty gynecologic surgical care have more complex procedures, more perioperative adverse events, and longer length of stay, without negative impact on perioperative quality of care, reoperation, or postoperative mortality.

**HARmonization OPERATIONS FOR GLOBAL TRIALS TO OVERCOME OBSTACLES FROM 2004 – 2017: GYNECOLOGIC CANCER INTERGROUP (GCIG)**

1Y Kajimoto*, 2M Bacon, 3B Stonebraker, 4B Votan, 5J Martyn, 6I Bryce, 7L Farrelly, 8K Carty, 9A Negrouk, 10G Elser, 11E Aotani. 1GOTIC, - Iruma-gun, Japan; 2GCIG, Cervix Cancer Research Network, Kingston, Canada; 3GOG Foundation, Roswell Park Cancer Institute- Biostatistics and Bioinformatics- Clinical Trial Development Division, Buffalo- NY, USA; 4GFINCO, n/a, Paris, France; 5ANZGGG, NHMRC Clinical Trials Centre- University of Sydney, Sydney, Australia; 6MTO, Università di Roma Tor Vergata- Istituto Nazionale Tumori IRCCS Fondazione G.Pascale, Napoli, Italy; 7NCRUK, Cancer Research UK and University College London Cancer Trials Centre, London, UK; 8SGCTG Scottish Gynaecological Cancer Trials Group, Department Cancer Research UK Clinical Trials Unit, Glasgow, UK; 9EORTC-CCG, International Policy Office, Brussels, Belgium; 10AGO Study Group, n/a, Wiesbaden, Germany; 11GOTIC, n/a, Iruma-gun, Japan

**Objectives** Occurrence of second invasive cancer in a diagnosed case of cancer patient and also in cancer survivors is not uncommon. Advances have been made in diagnostic and therapeutic modalities, leading to improvement in survival of cancer patients, and also, the incidence of second malignancy is on rise. Second malignancy can be synchronous or metachronous. Original studies about dual malignancy are very few. The present study aims to analyze the frequency and types of double malignancies in Gynaec oncology patient.

**Methods** This is a retrospective analysis of patients with synchronous dual cancers, treated from January 2009 to December 2018. The study included 12 patients with dual malignancies.

**Results** Out of 12 patients, 4 (33.3%) were of ovarian and endometrium origin and they were the most common in our study, followed by breast and endometrium (16.6%); breast and vulva (16.6%); breast and ovary (16.6%); breast with cancer cervix and cancer endometrium with colon cancer were least common (8.3%). Double malignancies involving the female reproductive tract, like cervix and vulva, can be explained by common etiological factors like Human papilloma virus (HPV). The same association has not been seen in our series which could be explained on the basis of small number of patients reported here.

**Conclusions** This study puts a light on the fact that oncologists should remain cognizant of the fact that dual cancer of the female genital tract and elsewhere in the body is not an unknown occurrence and a comprehensive workup is desirable at the time of initial presentation.
