HPV vaccination: a Tunisian challenge

Mohamed Aymen Ferjaoui, Tunis 1007, Tunisia

Tunisia is a North African country, a real bridge between Europe and Africa. Its population is approximately 11.5 million. In Tunisia, the incidence of cervical cancer is 4.1/100,000 women, and 300 new cases are diagnosed per year with 75% of these as advanced cervical cancer. It is the third gynecological cancer (including breast) and the second pelvic cancer after endometrial cancer. Systematic mass Papanicolaou (Pap) smear screening does not exist and it is done individually in public hospitals and private clinics. The coverage of Pap smear screening is low and does not exceed 17% of all Tunisian women, with inter-regional inequalities. In the interior regions of the country Tunisian women can miss their screening.

The Tunisian Society of Gynecology and Obstetrics (STGO) periodically organizes several campaigns for cervical cancer screening throughout the Tunisian territory. These events involve gynecological surgeons and fellows in gynecology and obstetrics. Cases where cervical disease is detected are managed in university departments of gynecology and obstetrics. STGO is also working to promote and introduce human papillomavirus (HPV) vaccination in the Tunisian vaccination calendar. Several meetings have been organized with the various stakeholders.

Vaccination coverage in Tunisia is approximately 97% and the schooling rate is 98%, thus allowing for generalized HPV vaccination. The biggest event was held on October 31 to November 2, 2019—the national STGO meeting—at which there was a special session advocating for HPV vaccination. Three major topics were presented: the interest of HPV vaccination, HPV vaccination in Africa, and the challenge of Tunisian gynecologists to introduce this vaccination to protect Tunisians. The official procedure is in an advanced phase and Tunisian gynecologists have received serious promises to make this dream come true.
