patients were treated with concurrent chemoradiation followed by brachytherapy. The median follow-up period was 47 months. The three-year DFS and OS were 13.3% and 13.3% respectively.

Conclusion CCCC has a poor prognosis, stage for stage compared to other histologies. The FIGO stage, tumour size, lymphovascular space invasion and pelvic node status were factors that predicted the prognosis. Adjuvant radiotherapy or chemoradiotherapy have a limited role in the treatment of this rare cancer.

285 EFFICACY OF A MULTI-INGREDIENT CORIOLUS VERSICOLOR-BASED VAGINAL GEL IN HPV+ WOMEN OLDER THAN 40 YEARS: SUB-ANALYSIS OF PALOMA CLINICAL TRIAL

1Yann Gaslain, 2Luis Serrano, 3Andrés Carlos López, 4Silvia González, 5Santiago Palacios, 6Damian Dereux, 7Pluvio Coronado, 8Jesús de la Fuente, 9José Antonio López, 10Cristina Vanelli, 11Procare Health; 12Centro Médico Gabinete Vélázquez; 13Hospital Quironsalud; 14Instituto Palacios Salud Y Medicina de la Mujer; 15Women’s Health Institute; 16Hospital Clínico San Carlos; 17Hospital Universitario Infanta Leonor; 18Hospital General Universitario de Alicante; 19Hospital de la Santa Creu i Sant Pau

Introduction/Background HPV clearance and resolution of cervical HPV-dependent lesions become important in peri- and postmenopausal women. The objective of this sub-analysis was to evaluate the effect of the Papilocare®, a multi-ingredient Coriolus versicolor-based vaginal gel, on the normalization of cervical HPV-dependent atypia (ASCUS and LSIL) and associated colposcopic alterations in women older than 40 years.

Methodology Paloma clinical trial (ClinicalTrials.gov NCT04002154) was a multicenter, randomized, open-label, parallel-group, usual practice-controlled clinical trial. Unvaccinated HPV positive women aged between 30–65 with cytology of ASCUS or LSIL and concordant colposcopic image were randomized into 3 groups: A) Papilocare® 1 cannula/day for 1 month + 1 cannula/alternate days for 5 months; B) Papilocare® 1 cannula/day for 3 months + 1 cannula/alternate days for 3 months; C) Control group: no treatment (usual clinical practice). Primary endpoint: % of patients with normal cytology and concordant colposcopy after 6 months of treatment in the total population, high-risk HPV (16,18,31,33,35,39,45,51,52,53,56,58,59,68) and very high-risk HPV, respectively. At 6 months, data of 148 and 146 patients for Pap smear and concordant colposcopy were available. 67.6% of patients (100/148) had negative Pap smear and normal colposcopy at 6/12 months is presented. The study was approved by the ethical committee of Public University Hospital of Puerta de Hierro (Madrid). Informed consent was signed by all patients.

Results At 6 months, data of 148 and 146 patients for Pap smear/concordant colposcopy and HR-HPV presence, respectively, were available. 67.6% of patients (100/148) had negative Pap smear and concordant colposcopy. HR-HPV clearance was observed in 58.9% of patients (86/146). Data of 46 and 44 patients included in the 6-month extension treatment period for Pap smear/concordacy and HR-HPV presence, respectively, were available. At 12 months, 78.3% (36/46) of patients had negative Pap smear and concordant colposcopy and HR-HPV clearance was observed in 70.5% (31/44). Considering all study period, 77% (114/148) and 72.6% (106/146) of patients repaired HR-HPV-dependent cervical lesions and cleared HR-HPV, respectively.

Conclusion In this interim analysis, repairing of HR-HPV-dependent low-degree cervical lesions and clearing HR-HPV, in real life conditions, was achieved after 6-month treatment
with Papilocare® (or extending it up to 12-months if needed) in 3 out of 4 patients. These findings need to be confirmed upon study completion.

**288** Efficacy of a multi-ingredient Coriolus versicolor-based vaginal gel in high-risk HPV+ patients: Results of different studies

Yann Gaslain, Javier Cortés, Damian Dexeus, Santiago Palacios, Clara Gajino, Giovanni Minello, Margarita Riera, Elena Mainín, Procure Health; Private Practice; Women’s Health Institute; Instituto Palacios Salud y Medicina de la Mujer; Hospital Materno Infantil Teresa Herrera; Institut Catala de la Salut; Hospital Alvira Cunqueiro

Introduction/Background To evaluate the consistency of the efficacy of a non-hormonal multi-ingredient Coriolus versicolor-based vaginal gel, Papilocare®, on HPV clearance in patients infected by high-risk HPV (HR-HPV) in several studies.

Methodology Results at 6 months from independent observational non-comparative studies carried out in three different public centers and in a one private center were compared to results from both a randomized, open, parallel and controlled clinical trial comparing the Papilocare® vs wait and see approach (The Paloma RCT) and a observational, multicenter, prospective, one-cohort study (Papilobs real-life study). Two prospective (Vigo and Bari studies) and two retrospective studies (Coruña and Hospitalat studies) have been performed.

Vigo study: HPV clearance of 25 patients infected by HPV 16 and/or 18 was evaluated as a secondary endpoint.

Bari study: HPV clearance of 98 HR-HPV patients was evaluated as primary endpoint.

Coruña study: 57 medical records of patients with HR-HPV were analyzed. HPV clearance was evaluated as primary endpoint.

Hospitalat study: Data of 91 HR-HPV patients were evaluated. Primary endpoint: composite efficacy variable (percentage of patients with normal cytology and/or HPV clearance).

Papilobs study: Interim data of 148 HR-HPV patients is presented. HR-HPV clearance was evaluated as secondary endpoint.

Paloma RCT: 66 HR-HPV patients were evaluated. Percentage of patients with HR-HPV clearance was assessed as a secondary endpoint.

Results After the 6-month treatment period, 48% and 57% of patients cleared HPV 16–18 and HR-HPV in Vigo and Bari studies, respectively. A reduction of 58% was observed in number of HR-HPV patients (Coruña) and 72.5% of patients negativized cytology and/or cleared HR-HPV (Hospitalat) (p≤0.0001 vs baseline for all results, Chi-square). In the Paloma RCT, HR-HPV clearance was observed in 63% of patients treated with Papilocare® vs 40% in the control group. Similar rate of 59% HR-HPV clearance was observed in the interim analysis of the Papilobs study.

Conclusion Papilocare® has shown significant and consistent rates of HR-HPV clearance ranging from 50% to 70% in the 6 different studies. This high consistently rate of HR-HPV clearance should be further confirmed in ongoing studies.

**306** Rationale and evidence for emerging antibody-drug conjugates in gynecological cancers: effect of online education on clinician knowledge

Geoff Fisher, Amy Furedy, Juliette Vanderbroucq, Nicole Concin, Medscape Global Education; Medical University of Innsbruck

Introduction/Background A number of targeted antibody drug conjugates (ADCs) are emerging with the potential to become important new treatment strategies for gynecological cancers, including recurrent/resistant ovarian and cervical cancers. This study determined whether online continuing medical education could improve the knowledge of oncologists and obstetricians/gynaecologists (obs/gyns) on the rationale and evidence for emerging ADCs.

Methodology A 30-minute online video lecture was launched for physicians outside the USA in December 2019. Data was collected to March 2020. Educational effect assessed with repeated-pairs pre-/post-activity, where individual participants served as their own control. 3 multiple-choice, knowledge questions and 1 self-efficacy, 3-point Likert scale confidence question were analyzed. Chi-squared test assessed pre- to post-activity change (5% significance level, P <.05). Magnitude of change in total number of correct responses overall, and for each question, were determined with Cramer’s V (,.06=Modest, 0.06-.15=Noticeable, .16-.26=Considerable, >.26=Extensive).

Results 49 oncologists and 154 obs/gyns completed pre- and post-activity questions. A positive educational effect was observed for oncologists (considerable effect, V=.217, P=.0002) and obs/gyns (noticeable effect, V=.097, p=.0028) with average% of correct responses increasing 40 to 62% for oncologists and 34 to 43%, for obs/gyns. Participants with 3/3 answers correct increased from pre- to post-activity (6 to 35% for oncologists and 6 to 12%, for obs/gyns). Improvements in % of correct responses post-activity were seen for all 3 knowledge-based questions on antigen targets, and key trial data for tisotumab vedotin and mirvetuximab vedotin (88%, 39%, 45% improvements for oncologists; 70%, 15%, 16% improvements for obs/gyns). Confidence in knowledge of ADCs also improved post-activity with a total average confidence shift of 38% for oncologists and 32% for obs/gyns. 62% of oncologists’ and 44% of obs/gyns’ responses were reinforced or improved post-activity. 34% of all participants stated they would modify treatment plans as a result of participating in the activity.

Conclusion This on-demand, online video lecture resulted in a positive education effect for both oncologists and obs/gyns. However, persistent knowledge gaps are evident, especially amongst obs/gyns, suggesting there is a need for additional education as data on ADCs continues to emerge. Online medical education is valuable in establishing improved knowledge...
