691 FERTILITY-SPARING RADICAL TRACHELECTOMY FOR EARLY STAGE CERVICAL CANCER: 12 CASES SERIES AND LITERATURE REVIEW

N Doan*, T Nguyen, L Ta, L Luong. Oncology Hospital at Ho Chi Minh city, Gynecology Surgery, Ho Chi Minh, Vietnam

10.1136/ijgc-2021-ESGO.57

Introduction/Background* Radical trachelectomy is an alternative treatment for preserving fertility in selected patients with early stage cervical cancer. The purpose of this report is to describe our technique of abdominal radical trachelectomy and review the current literature on this procedure.

Methodology We reported 12 cases of radical trachelectomy with pelvic lymphadenectomy in The Oncology Hospital of Ho Chi Minh city between 7/2018 and 9/2020.

Results* The characteristics of the 12 adult patients who underwent radical trachelectomy included stage IB1 disease in all cases, a mean age of 31 years (range, 29–41), and a median estimated blood loss of 100 ml (range, 70–150). Among of them, one case was performed by laparoscopic approach. No one need adjuvant treatment after surgery and all patients resumed normal menstruation postoperatively. All patients remain disease-free at the time of this report. The only remaining uterine blood supply in these patients are the utero-ovarian vessels. There were one postoperative complication. It was one case of cervical stenosis. Transurethral Foley catheters were removed in all cases at postoperative days 2–4.

Conclusion* Radical tracheectomy with pelvic lymphadenectomy is a feasible operation for selected women with early stage cervical cancer who desire to preserve reproductive function. Menstruation and reproductive function may be preserved after bilateral uterine vessel ligation.

694 CERVICAL CANCER APPLICATION (CER-CAP): A NEW APP FOR ESTIMATION OF THE LYMPH NODAL RISK INVASION IN PATIENTS WITH EARLY-STAGE CERVICAL CANCER

Introduction/Background* Lymph node status is a major prognostic factor in early-stage cervical cancer. According to the International Federation of Gynecology and Obstetrics (FIGO) 2018 classification, the presence of metastatic lymph node involvement, including the presence of macrometastasis (MAC) or micrometastasis (MIC), is classified as stage IIIC. The recommended treatment is a combination of chemoradiation without complete surgery. Assigning initial staging of patients is therefore essential for the therapeutic management.

Methodology We performed a secondary analysis of data from two prospective multicenter trials assessing the role of the sentinel node in the surgical management of cervical cancer (SENTICOL 1 and 2 pooled together in the training dataset). The histological risk factors were included in a multivariate logistic regression model in order to determine the most suitable prediction model. An internal validation of the chosen prediction model was then carried out by a cross validation of the ‘leave one out cross validation’ type. The prediction model implemented into an interactive online application of the ‘Shinyapp’ type. Finally, an external validation was performed with a retrospective cohort of L’Hotel-Dieu de Quebec in Canada.

Results* Three hundred twenty-one patients participating in Senticol 1 and 2 were included in our training analysis. Among these patients, 280 did not present lymph node invasion (87.2%), 13 presented ITC (4%), 11 presented MIC (3.4%) and 17 MAC (5.3%). Tumor size, presence of lymphovascular space invasion and stromal invasion were included in the prediction model. The Receiver Operating Characteristic (ROC) Curve from this model had an area under the curve (AUC) of 0.79 (95% CI [0.69–0.90]). The AUC ROC curve from the cross validation was 0.63. The external validation on the Canadian cohort confirmed a good discrimination of the model with AUC ROC of 0.83.

Conclusion* This is the first study of a prediction score for lymph node involvement in early-stage cervical cancer that includes internal and external validation of a prediction score for lymph node involvement in early-stage cervical cancer. The web application is a simple, practical, and modern method of using this prediction score in clinical management.
