Objectives To evaluate clinicopathological features and survival outcomes of pure dysgerminoma of the ovary

Methods We retrospectively recorded clinicopathological and therapeutic data of 31 patients with pure dysgerminoma of ovary treated at the Salah Azaiez Institute of Tunisia between 1970 and 2012.

Results The median age was 22 years (12–60 years). The distribution of patients according FIGO stage was as follows: stage I:16 (51.6%), stage II: 3 (9.7%), stage III: 11 (35.5%) and stage IV: 1 case. Radical surgery was performed in 11 patients and conservative surgery in 20 patients (64.5%) associated with node picking lymphadenectomy in 7 cases and complete lymphadenectomy in 7 cases. Complete macroscopic resection was obtained in 22 cases (70.96%) and lymph node metastasis was observed in 51.1% of cases. Adjuvant chemotherapy was indicated in 15 cases and adjuvant radiotherapy in 10 cases. After a mean time follow-up of 74 months (7–182 months), complete remission was observed in 26 patients. The 5-year progression-free survival (PFS) was 85.2%. The 5-year overall survival (OS) was 89.5% and was significantly decreased in the advanced stage (100% in stage I-II vs 75% in stage III-IV; p=0.02). There was a significant difference in OS and PFS between complete resection and residual disease groups (100% vs 67.5%; p=0.03 and 88.9% vs 75%; p=0.03, respectively). No difference in OS and PFS was noted following stratification by age ≤50 years (p=0.36 and p=0.1), tumor size ≤10 cm (p=0.27 and p=0.68) and as a consequence of radical surgery (p=0.87 and p=0.17).

Conclusions Macroscopic residual disease, as well as advanced FIGO stage, were the main prognostic factors in pure dysgerminoma of the ovary.

## Real-world Data Analysis of Second-Line Poly (ADP-ribose) Polymerase Inhibitor Maintenance Therapy in Patients with Advanced Ovarian Cancer

### EPV201/#44

#### Objectives

Poly(ADP-ribose) polymerase inhibitors (PARPis) have been recommended since 2017 as second-line (2L) maintenance treatment by the NCCN for ovarian cancer (OC) patients with or without BRCA1 or BRCA2 (BRCA) alterations. Here, we assessed PARPi use from real-world data.

#### Methods

From the iKnowMed electronic health record database of the US Oncology Network (>470 sites), adult females were included if they were diagnosed with advanced OC, received a 2L platinum-containing regimen for advanced OC, and had ≥2 visits between 1 January 2016 and 1 July 2020. Patients were followed until 31 October 2020, last patient record, or death, whichever occurred earliest. A 24-month landmark survival analysis was performed.

#### Results

Out of 11,494 patients diagnosed with advanced OC, 1051 met the inclusion criteria; 513/1051 (49%) subsequently received any maintenance therapy (table 1). The proportion of patients receiving 2L PARPi maintenance increased from 17% in 2018 to 34% in 2019 but decreased to 22% in 2020 (figure 1). Among BRCA+ patients, 33% (46/140) received 2L PARPi maintenance, while documented BRCA- patients received any maintenance therapy (table 1). The proportion of patients receiving 2L PARPi maintenance increased from 17% in 2018 to 34% in 2019 but decreased to 22% in 2020 (figure 2). The median age was 22 years (12–60 years). The distribution of patients according FIGO stage was as follows: stage I:16 (51.6%), stage II: 3 (9.7%), stage III: 11 (35.5%) and stage IV: 1 case. Radical surgery was performed in 11 patients and conservative surgery in 20 patients (64.5%) associated with node picking lymphadenectomy in 7 cases and complete lymphadenectomy in 7 cases. Complete macroscopic resection was obtained in 22 cases (70.96%) and lymph node metastasis was observed in 51.1% of cases. No difference in OS and PFS was noted following stratification by age ≤50 years (p=0.36 and p=0.1), tumor size ≤10 cm (p=0.27 and p=0.68) and as a consequence of radical surgery (p=0.87 and p=0.17).

#### Conclusions

Our data suggest a significant proportion of eligible patients are not receiving 2L maintenance therapy despite treatment guideline recommendations and apparent survival benefits associated with its use.

## Sentinel Lymph Node Identification in Early Stage Ovarian Cancer: Is It Still Possible After Prior Tumor Resection?

### EPV202/#446

#### Objectives

Sentinel lymph node (SLN) detection in ovarian cancer is feasible when tracers are injected before the pathological ovary is resected. This study aims to investigate...
