0.03). Peritoneal carcinoma index, body mass index, moderate to severe renal failure, weight loss, ASA score and histological type were associated with the occurrence of VTE at the diagnosis of ovarian cancer. VTE predictive nomogram created in this population had good internal agreement (AUC = 0.81, CI95% 0.73 – 0.89).

Conclusion The incidence of VTE is high during ovarian cancer management, with many asymptomatic events. The impact of VTE is unfavorable on OS. The use of a nomogram could allow an earlier screening and thus improve the management and prognosis of patients. These results raise the question of systematic screening and its modalities in this population.

Abstract 2022-RA-453-ESGO

Conclusion In conclusion, a significant number of cases presenting omental cake might not be candidates for per primam cytoreduction and might need neoadjuvant chemotherapy.

Abstract 2022-RA-454-ESGO

Introduction/Background Krukenberg tumors are frequently encountered in the setting of digestive or breast cancer; however, in certain cases pulmonary origin can be also encountered.

Methodology The aim of the current paper is to report two such cases.

Results The first case was the one of a 73 year old female who has been previously investigated for severe weight loss and dysphagia and who was diagnosed with a tumoral mass at the level of the mediastinum in association with a pulmonary nodule measuring 1.5 cm at the level of the left lung and with an ovarian tumour measuring 4/5 cm. The patient was submitted to a laparoscopic adnexectomy, the final diagnostic being of an ovarian pulmonary metastasis. The patient was further submitted to systemic chemotheraphy; at two year follow up she presented a significant decrease of the adenopathic mass, the disparition of the pulmonary nodule. The second case was the one of a 39 year old patient with previous history of...
neuroendocrine pulmonary tumor with local invasion and poor response to radiochemotherapy; however during therapy she was diagnosed with bilateral ovarian tumors and ascites which significantly impeded the respiratory function. In order to exclude the presence of a synchronous ovarian cancer and to improve the respiratory function, a total hysterectomy with bilateral adnexectomy was performed; meanwhile 5.5 l of ascites were removed. The histopathological studies demonstrated the metastatic origin of the lesion and enabled the oncologist to administrate a second line cytotoxic therapy. However, the patient died of disease after the first cycle of chemotherapy.

Conclusion Although very rare conditions, Krukenberg tumors from ovarian cancer should be suspected whenever an association of confirmed pulmonary malignancy and incidental suspect ovarian tumors are found.

TYPICAL RECURRENCES OF OVARIAN GRANULOSA CELL TUMOR RECURRENCE
Nicolaie Bacalbasa, Irina Balescu. Carol Davila University, Bucuresti, Romania

2022-RA-455-ESGO

Introduction/Background Ovarian granulosa cell tumors represent a particular subset of ovarian tumors characterized through a low rate of multiplication of the tumoral cells and a low risk of developing distant metastases. However, in isolated cases recurrences might develop.

Methodology The current paper presents the cases of two patients diagnosed with mesosigmoidian metastases from ovarian granulosa cell tumors.

Results The first case was investigated for diffuse abdominal pain after an incidental abdominal trauma while the second case was investigated for subocclusive syndrome. In the first case the preoperative suspicion of diagnostic was of a retroperitoneal hematoma while in the other case the preoperative suspicion of diagnostic was of peritoneal carcinomatosis. Intraoperatively in the first case a large ruptured recurrence with perilesional hematoma was found while in the second case a recurrent tumor at the level of the mesosigmoidian area, in close contact with the sigmoidian lumen was found. In both cases a rectosigmoidian resection was performed, the histopathological studies demonstrating the metastatic origin of the lesion and enabled the oncologist to administrate a second line cytotoxic therapy. Therefore 27.9% for right hemicolectomy with primary anastomosis and 16.3% for left hemicolectomy with primary anastomosis. Respondents often involved colorectal support for post-operative complications.

Conclusion Although very rare conditions, Krukenberg tumors from ovarian cancer should be suspected whenever an association of confirmed pulmonary malignancy and incidental suspect ovarian tumors are found.

GYNAE-ONCOLOGY SURGEONS’ PREPAREDNESS TO UNDERTAKE COLORECTAL PROCEDURES DURING CYTOREDUCTIVE SURGERY FOR OVARIAN CANCER: A CROSS SECTIONAL SURVEY

1Daniel Huddart, 2Savithri Rajkumar, 1Gautam Mehta, 1Rahul Nath, 1Ahmad Sayasneh, 1Women’s Health, Guy’s and St Thomas’ NHS Foundation Trust, London, UK; 2King’s College London, London, UK

2022-RA-456-ESGO

Methodology An anonymous, online survey was emailed to members of the BGCS to assess the current status of multidisciplinary working between gynaecological oncology and colorectal/general surgical teams in the UK. The survey explored access to colorectal surgeons in the pre and peri operative periods and the role of colorectal/general surgical support in common bowel procedures performed during cytoreductive surgery, alongside their input with surgical complications and post-operative management.

Results 46 members responded (8.2% response rate). There was a large variety in the involvement of colorectal and general surgical teams in pre-operative planning. Despite nearly all respondents working in tertiary care centres, 13% of respondents had no formalised agreement for intraoperative support. 72.1% of respondents independently performed rectal peritoneal stripping and 60.5% of respondents independently performed small bowel resection. This reduced to only 27.9% for right hemicolectomy with primary anastomosis and 16.3% for left hemicolectomy with primary anastomosis. Respondents often involved colorectal support for post-operative complications.

Conclusion Overall, the degree to which gynaecological oncologists independently perform bowel procedures varies within the UK. The majority involve colorectal or general surgical teams in such procedures. Surgical team involvement is more common for large bowel procedures compared to small bowel procedures.
