are a vulnerable population so timely provision of screening programs is of utmost importance in this population. As a step forward in this direction, cervical cancer screening was undertaken in female prisoners.

**Methodology** This was a cross-sectional study conducted on women inmates in one of the largest prison’s of North India. 281 women prisoners aged 18 and older were interviewed using a questionnaire. After an informed consent, women were screened using VIA (Visual inspection with acetic acid).

**Results** Majority of the women (84.03%) were between 21 to 40 years. One. Eighty two women (64.7%) were illiterate, and they form an under-screened group. Screening and intervention programs must be in place to ensure organization of health services within the prison environment so that screening, diagnosis and treatment for cervical cancer can be provided at early stages to minimize morbidity and mortality.

**Conclusion** Women prisoners are at a increased risk of cervical cancer because of high risk behaviours. Unfortunately their health often is neglected and they form an under-screened group. Screening and intervention programs must be in place to ensure organization of health services within the prison environment so that screening, diagnosis and treatment for cervical cancer can be provided at early stages to minimize morbidity and mortality.

**IMPLEMENTATION OF OPPORTUNISTIC SALPINGECTOMY FOR PREVENTION OF OVARIAN CANCER: RETROSPECTIVE STUDY**

Malou Gelderblom, Obstetrics and Gynecology, Radboudumc, Nijmegen, Netherlands

**Introduction/Background** Opportunistic salpingectomy (OS) refers to additional removal of the fallopian tubes during abdominal surgery performed for another medical indication, as prevention for ovarian cancer. Since OS has been inconsistently implemented, its clinical practice varies worldwide. To reduce this variation, insight is required into current clinical practice and associated characteristics. Therefore, the study aim was to determine the uptake of counselling and performance of OS, and its associated patient, surgical, physician, and hospital characteristics.

**Methodology** Retrospective study using electronic medical records from six different Dutch hospitals: two academic, two large teaching, and two non-teaching hospitals. Patients were considered eligible for OS if they underwent elective non-obstetric abdominal surgery for a gynecological indication from January 2015 through December 2018. Primary outcomes were uptake of counseling and performance of OS. Multilevel multivariable logistic regression analyses were conducted to identify characteristics associated with OS.

**Results** Counselling of OS increased significantly from 2.9% in 2015 to 29.4% in 2018. In this period, 440 patients were counselled on OS of which 95.9% chose for OS. Performance of OS increased significantly from 6.9% in 2015 to 44.5% in 2018. The contraceptive pill was found in any DO specimens.

**Conclusion** While the uptake of OS increased from 2015 to 2018, the majority of patients who were eligible for OS were not counselled and did not undergo OS. Its clinical practice varies on patient, surgery and physician characteristics. Therefore, an implementation strategy tailored to these associated characteristics is recommended.

**PROPHYLACTIC RADICAL FIMBRIECTOMY WITH DELAYED OOPHORECTOMY IN WOMEN WITH A HIGH RISK OF DEVELOPING AN OVARIAN CARCINOMA: RESULTS OF A PROSPECTIVE PHASE 2 NATIONAL STUDY**

1Eric Leblanc, 1Fabrice Narducci, 1Houssein El Haji, 2Gwenaël Ferron, 3Audrey Mailliez, 3Jean-Yves Chanovin, Calos Martinez Gomez, 4Frederic Guyon, 5Anne Sophie Lemaire, 5Virginie Fourchotte, 6Alícia Probst, 7Eric Lambaudie, 8Emmanuelle Tresch, 9Isabelle Fournier, 10Véronique Vani-Coven, 11Francois Gollier, 12Christophe Pomel, 13Frederic Caquant, 14Pierre Collinet, 15Sebastien Gouy, 16Yves Fouche, 17Agathe Crouzet, 18Marie Cecile Le Deley, 19Delphine Hudry, 20Gynecologic Oncology, Oscar Lambret Cancer Center, Lille, France; 21Centre Claudius Regaud, Toulouse, France; 22Clinique du Bois Lille France, Lille, France; 23Institut Jean-Allan Bergonie, Bordeaux, France; 24Pathology, Oscar Lambret Cancer Center, Lille, France; 25Institut Curie, Paris, France; 26Biostatistics, Oscar Lambret Cancer Center, Lille, France; 27Institut Paoli Calmettes, Marseille, France; 28INSERM U1192, Université de Lille, Lille, France; 29Polyclinic du Pari Ramot, Aix en Provence, France; 30Hospices civils de Lyon, Lyon, France; 31Centre Jean Perrin, Clermont-Ferrand, France; 32Hôpital privé de Villeneuve d’Ascq, Lille, France; 33Hôpital Jeanne de Flandre, Lille, France; 34Institut Gustave Roussy, Villejuif, France; 35Centre Antoine Lacassagne, Nice, France; 36Centre Henri Bequeusel, Rouen, France

**Introduction/Background** Risk-reducing salpingo-oophorectomy is the gold standard for prophylaxis of ovarian cancer in high-risk women. Due to significant adverse effects, 20–30% of women delay or refuse early oophorectomy. We proposed a new two-step risk-reducing procedure: radical fimbriectomy followed by delayed oophorectomy, which is evaluated by the current RF/DO Phase 2 trial (NCT01608074).

**Methodology** Pre-menopausal women ≥33 years with HBOC who refused RRSO were offered to participate in RF/DO trial. All surgical specimens underwent the SEE-FIM protocol. The primary endpoint was the cumulative incidence of ovarian/pelvic invasive carcinoma. Secondary endpoints were morbidity, surgical specimen abnormalities, menopause, breast cancer (BC) occurrence, and secondary oophorectomy.

**Results** From January 2012 to October 2014, 121 patients underwent RF, 51 were performed in the ambulatory setting. Occult neoplasia was found in two cases, with one tubal HGSC. Two patients experienced grade-1 intraoperative complications. No early or delayed grade ≥3 postoperative complications. After 7.3 years of median follow-up, no cases of pelvic invasive cancer were noted. 3/52 patients developed de novo BC. One BRCA1-mutated woman delivered safe twins. 25 patients underwent menopause including 15 who had received chemotherapy for BC: 23 before DO and two did not undergo DO. Overall, 46 women underwent DO, 23 after menopause, 3 after the age of 51, 8 for personal decision, and 11 for other medical reasons. No abnormalities were found in any DO specimens.
Conclusion RF/DO appears a safe and well-tolerated risk-reducing approach that avoids early menopause for HBOC patients. Furthermore, due to the absence of abnormalities at mesothelio-Müllerian junctions, simple total bilateral salpingectomy may replace RF performed. All women also completed a questionnaire on a sexual habit.

Results A total of 100 women were enrolled between 2019 and 2021. Among these, eight patients had a concomitant or past diagnosis of anogenital warts, while one patient had a previous diagnosis of VaIN-HSIL. Anal Pap smears were positive for low-grade lesions in three patients, while 73 women tested positive for aHPV-DNA. Histological examination revealed the presence of AIN2–3 lesions in four patients, who subsequently underwent excisional treatment. Although 50% of aHPV-DNA positive women reported having anal intercourse, as many as 45% of these declared they used condoms.

Conclusion Women with CIN2–3 are at high-risk of developing AIN2–3, although to date no recommendations regarding prevention and treatment of AIN in this group of patients are available. Barrier methods aren’t always effective to prevent anal HPV infection, probably due to the fact that the cervix is a reservoir of the infection.

Methodology The objective of this monocentric prospective study was to analyze the prevalence of AIN2–3 among women treated for CIN2–3. Exclusion criteria were: age <25 years, previous HPV vaccination, immunosuppression, HIV infection and a history of anorectal cancer. All patients enrolled in the study underwent anal cytology and anal high-risk HPV-DNA testing (aHPV-DNA). If one or both tests were positive a high-resolution anoscopy with biopsy of suspicious lesions was
