Introduction/Background
The natural history of invasive vaginal cancer has been minimally investigated. We aimed to investigate HPV distribution and prognostic factors in vaginal cancer (VC).

Methodology
We retrospectively reviewed medical records of patients with VC who received primary treatment between 1989 and 2020. General polymerase chain reaction (PCR) SPF1/GP6+ followed by revert-blot detection was performed for human papillomavirus (HPV) genotyping. E6 type-specific PCR of the top-5 prevalent types was performed to reconfirm HPV-negative status. P16INK4a immunohistochemistry staining was performed. Univariate and multivariate analyses were performed to identify predictors of clinical outcomes.

Results
A total of 73 vaginal carcinoma patients eligible for analysis. Median follow-up time was 88.6 months (range 0.56–239.5 months). 66 patients (90.4%) were diagnosed as squamous cell carcinoma (SCC) and 7 (9.6%) as non-SCC. HPV DNA sequences were detected in 88.7% of SCC specimens, and 83.3% of non-SCC VC (P = 0.543). The leading types were HPV16 (51.7%), HPV52 (13.3%) and HPV58 (11.7%). HPV-positivity was associated with better 5-year cancer-specific survival (CSS) (70.8% vs 35.7%, P = 0.005). Because there was strong correlation between p16-positivity and HPV-positivity (P < 0.001), they were alternatively entered in multivariate analysis. In both models, pelvic lymph node (PLN) metastasis (HR 4.72, 95%CI 1.505–14.804, P = 0.008) or 6.35, 95%CI 1.871–21.564, P = 0.003) was a significant adverse predictor of CSS, while p16 (HR 0.049, 95% CI 0.01- 0.229, P <0.001) or HPV-positivity (HR 0.129, 95%CI 0.036–0.466, P = 0.002) was related to better prognosis.

Conclusion
PLN metastasis was a significant adverse predictor, while p16-positivity or HPV-positivity (alternatively) was a significant factor of better prognosis.

LAPAROSCOPIC ANTERIOR RESECTION WITH TOTAL VAGINECTOMY

VVN Raju K, Pawan kumar Jonnada, Zeeba Usofi, B Madhu, K Pradeep, Syed Nusrath.

Introduction/Background
This is a video demonstration of laparoscopic anterior exenteration with total vaginectomy for vaginal squamous cell cancer in a young female.

Methodology
Techniques of dissection and surgical demonstration of anterior exenteration with total vaginectomy

Results
Video demonstrated in the given format

Conclusion
Laparoscopic anterior exenteration with total vaginectomy is an acceptable surgical procedure with minimal morbidity for the management of locally advanced vaginal cancer.

SIGMOID NEOVAGINA AND DOUBLE V-Y FLAP RECONSTRUCTION AFTER A TOTAL PELVIC INFRALEVATOR EXENTERATION
