Introduction Early-stage cervical cancer cases are still recorded among young age patients despite awareness about screening and vaccination. Fertility preserving surgery is the management of choice for those age group. Previously, radical trachelectomy was done with different approaches. Nowadays, Robotic-assisted surgery is replacing previous techniques for better outcomes. This video is representing Robotic-assisted radical vaginal trachelectomy.

Description

Vaginal Phase – Cervical amputation – Cervical Cerclage

Conclusion/Implications To enhance the Robotic approach for such cases.

SF005/#592  ROBOTIC-ASSISTED REMOVAL OF METASTATIC BULKY PELVIC LYMPH NODES FOLLOWED BY CONCURRENT CHEMORADIATION IN A PATIENT WITH FIGO STAGE IIC2R CERVICAL ADENOCARCINOMA
Eun-Ju Lee*. Chung-Ang University Hospital, Obstetrics and Gynecology, Seoul, Korea, Republic of

Introduction Radiotherapy is preferred in the cases if lymph node involvement is detected before surgery. However, radiotherapy with standard dose is insufficient to sterilize bulky lymph nodes > 2 cm. The resection of bulky lymph node metastasis before radiotherapy has been proposed to provide a therapeutic benefit.

Description A sixty-four-year-old woman had been diagnosed of cervical adenocarcinoma with a biopsy. Gynecological examination and computed tomography detected both parametrial involvement and metastatic nodes about 3.3 cm and 2.1 cm in size at bilateral obturator fossa. Concurrent chemoradiation therapy was planned after the removal of the bulky nodes. A two-trocar transperitoneal approach with accessory port for assistant was used. After establishing retroperitoneal space, the ureter was retracted medially. Right node that was 3.3 cm in size was between the external iliac vein and internal iliac artery and extended to the obturator fossa. The operation was followed by the left pelvic node removal. The robotic-assisted operation time was 124 minutes and the hospital stay was four days. The patient received concurrent chemoradiation therapy and had well been for one year with no evidence of disease.

Conclusion/Implications The bulky lymph nodes which were difficult to be eradicated with standard radiation therapy were successfully resected with robotic-assisted surgery. The removal of bulky nodes followed by radiation therapy may provide a therapeutic benefit.

SF006/#821  RADIAL TRACHELECTOMY: IMPORTANCE OF ROUND LIGAMENT AND SAMPSON’S ARTERIES TO UTERINE BLOOD SUPPLY EVALUATION BY INDOCYANINE GREEN FLUORESCENCE

Introduction Radical Trachelectomy is a choice for cervical cancer treatment and preserve fertility in selected cases. Good uterine perfusion is necessary for fertility. Sampson’s arteries preservation may be a good way of uterine perfusion. Blood flow evaluation by indocyanine green fluorescence on round
