On the basis of evidence, gynecologic oncologists exert substantial effort to achieve no residual macroscopic disease to obtain the best oncologic outcomes in cytoreductive surgery for ovarian cancer. In this regard, it is essential to deal with upper abdominal metastases and to be familiar with related surgical procedures. Right upper quadrant cytoreduction harbors serious potential for complications and morbidities, making it one of the most time-consuming and challenging procedures for clinicians to perform. To avoid complications and potential morbidities a good knowledge of surgical anatomy is crucial for performing these procedures and techniques.<sup>1,2</sup>

In this video, we demonstrate the surgical anatomy of the right upper quadrant after complete tumorous clearance in a 72 year old woman operated for advanced ovarian cancer with extensive peritoneal carcinomatosis and implants in the right upper quadrant.

## Video article

**Contributors** GK, MM, ZD performed the surgery and recorded the video. GK edited the video. MM narrated it. GK, MM wrote the draft. UKG, ABG, MAV reviewed the draft. MAV reviewed and supervised the final video. All authors approved the final edition. GK is the guarantor author.

**Funding** The authors have not declared a specific grant for this research from any funding agency in the public, commercial or not-for-profit sectors.

**Competing interests** None declared.

**Patient consent for publication** Consent obtained directly from patient(s)

**Ethics approval** This study involves human participants but as video article, EC approval was not obtained. Participants gave informed consent to participate in the study before taking part.

**Provenance and peer review** Not commissioned; externally peer reviewed.

**Data availability statement** All data relevant to the study are included in the article or uploaded as supplementary information.
