

Supplementary Figure S2. Characteristics of endometrial carcinomas (ECs) classified based on molecular profiling of data from The Cancer Genome Atlas.

(A) Relapse-free survival curves for patients in the four subgroups. The samples were classified based on a previous report.[1]

(B) T cell-inflamed signatures in the subgroups. Asterisks and double asterisks represent significant differences corrected without and with Bonferroni's method, respectively ( $p < 0.01$  and  $0.01/6$ ).

(C) Distribution of the molecular classification of ECs. POLE, polymerase-epsilon; MSI, microsatellite instability; CN, copy number.
