## Supplementary table 2. A summary of tips for carrying out the procedure

No.	Tips
1	To expose and mobilize the key structures (such as the ureter, the obturator nerve, and so on) surrounding the lesions to avoid incidental injuries
2	To resect the mass in a logical way:
	First, dividing the right ureter and mobilizing the internal iliac artery and
	obturator nerve to free the right lateral side of the mass.
	Second, cutting the side wall peritoneum and opening the rectovaginal space
	to free the left lateral side of the mass.
	Third, separating the posterior vesical wall from the vaginal stump and the
	mass, and dividing the right ureter stump to free the caudal end of the mass.
	Fourth, dividing the right internal iliac artery to free the superior end of the
	mass.
	Fifth, resecting the mass along its lower edge and removing it from the
	vagina.
	Sixth, performing accurate hemostasis and closing the vaginal cuff.
